Trace Contamination

NIST (J. Verkouteren)
Journal of Forensic Sciences 52 (2), 335–340

**Understand
the source**

- For manufacture there are Mil Spec explosives particulate sizes
- Munitions or IED surfaces are contaminated with trace particulate explosives.
- Fingerprints from C4 particles generate particle size range
 - @ 20 micron original size of particle
 - @ 4 μ grams in 1st print
 - @ 0.4 μ grams in 10th print

Explosives & Spectral Characteristics

Explosive	Functionality
TNT	C-NO ₂
RDX	C-N-NO ₂
HMX	C-N-NO ₂
TETRYL	C-N-NO ₂
PETN	C-O-NO ₂
NG	C-NO ₂
EGDN	C-O-NO ₂
Am. Nitrate	NH ₄ NO ₃
Urea Nitrate	CH ₅ N ₂ O, NO ₃

- Example Infrared Absorption Bands:

- Covalent nitrate: 6.1-6.6 μm
- Ionic nitrate: 7.0-7.5 μm

6.25 microns targets the common explosives
 (Common materials have low absorption in this region)

Infrared Spectra of TNT, DNT & RDX

- Low transmission at absorption bands
- Several absorption bands are common to these explosive materials
- 6.25 μm targets common explosives
 - N-O asymmetric stretch
 - common materials exhibit low absorption in this region
- Fortuitous transmission window at 6.25 μm
 - offers stand-off interrogation

R. Furstenberg et. al, Applied Physics Letters, **93**, 224103 (2008)

Remote Explosive Detector (RED)

Concept

U. S. Patent Application 12/255,103
International Patent # WO2009055370

- IR lasers can be used to resonantly couple energy to explosives, drugs, or other chemicals
- **Eye-safe**, stealth detection
- Thermal radiation can be collected and analyzed at stand-off distances

Kendziora et. al.
Naval Research Laboratory

Explosives Detection Workshop

Quantum Cascade Laser

IR photon source

- Microfabricated laser
 - foundry fabrication in quantity \rightarrow inexpensive devices
 - Compact IR source
- Single wavelength output
 - targets specific functional groups
- Room temperature operation
- Up to 1 Watt CW output
- Commercially available
 - We buy C-mounted QCL from AdTech Optics
 - We buy turn-key QCL from Daylight Solutions, Inc.

Quantum Cascade Laser (QCL)

NRL (FLIR) Thermal Imager

- **FLIR (Indigo) Photon Block II**

- Un-cooled bolometer array
- 320 X 240 pixels (38 μm)
- Analog and digital output
- B&W or false color images
- Movies here with 50 mm IR lens
- NETD (noise equivalent temperature) @85 mK
- Filter limits coverage to 7-12 microns (2-12 nominal)
- “OEM” platform – already fielded for applications
- Small, light, relatively low power
- 30 frames/sec (33 mS between frames)
- Intrinsically limited response time (slow cooling)

Remote Explosives Detection (RED) Testbed

- Dedicated Testbed
- 4' X 8' table
- Co-aligned lasers
- Co-linear incident and detection paths
- Digital software interface array readout
- Environmental chamber (not shown in photo)

Standoff Detection of TNT

- 1 meter standoff (not limited to this distance)
- 20 mW, $\lambda=6.25$ micron, 10 mm diameter QCL beam
- ΔT is ~ 1 °C for bright grain seen in both images.
- Individual particles @ 10-100 microns (0.8 – 800 ng)

R. Furstenberg et. al, Applied Physics Letters, **93**, 224103 (2008)

Cart-based System Design

For Field Testing

- “Cart-mounted” components:

1. QCL module (4 lasers)
2. Collection optics (lenses and mirrors)
3. Steering gimbal
4. Co-focused:
 - IR detector
 - visible camera
5. Computer based:
 - System control software
 - Signal processing/alarm algorithm

RED cart-mounted system of integrated components for field testing.

9 October 2009

Optical Layout

- Modular design
- Co-aligned:
 - QCL excitation
 - IR detection
 - Visible alignment
- 12 mm collimated beam for long standoff
- IR and visible imaging systems are co-focused
- **Approved eye-safe** for use around people by Navy Laser Safety Review Board

Kendziora et. al.
Naval Research Laboratory

*Explosives Detection Workshop
at the University of Rhode Island*

9 October 2009

QCL Module Layout

RED QCL Module

- 5.2 μm (~30 mW) “off resonance 1”
- 6.25 μm (~30 mW) “on resonance 1”
- 7.41 μm (~30 mW) “on resonance 2”
- 658 nm –alignment laser (~ 1 mW)
- Co-linear, 12 mm collimated
- Pick-off beam for output power normalization
- Operate independent of temperature

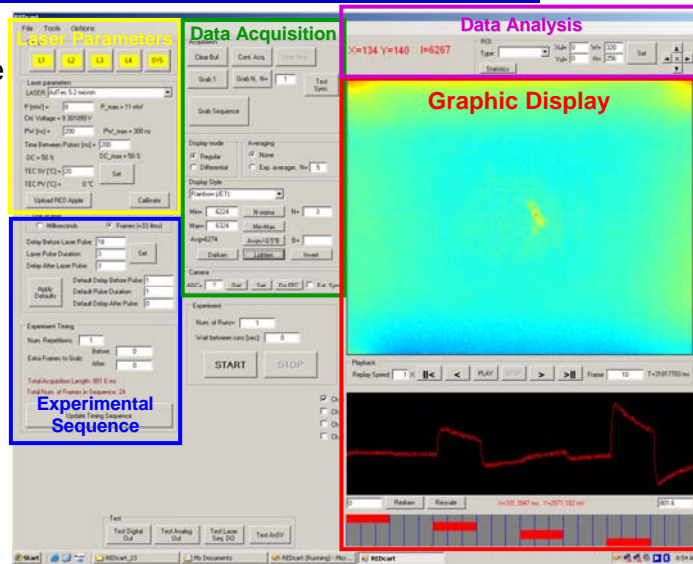

Kendziora et. al.
Naval Research Laboratory

*Explosives Detection Workshop
at the University of Rhode Island*

9 October 2009

RED Cart Software Interface

- Written in-house for this specific application
- Microsoft Visual Studio C Sharp
- Synchronizes experiment
- Monitors output
- Graphic display
- Analyzes data

Kendziora et. al.
Naval Research Laboratory

Explosives Detection Workshop
at the University of Rhode Island

9 October 2009

Experimental Sequence and Signal Processing

1. Control/synchronize QCL pulsing sequence
2. Correlate detector signal with output λ
3. Turn a series of signals into a differential
4. Then into an on/off resonance comparison
5. Three wavelengths for enhanced selectivity
6. Process into an alarm signal

Field Testing at Yuma Proving Ground

- Effects of temperature, sunlight, humidity, dust
- TNT, RDX, PETN, C4, Tetryl, Comp B, PBX4, PE4
- Best data at 10 meter
- Data out to 30 meter
 - difficult to stabilize optics
- Camera and single channel
- Very challenging environment
 - For electronics, optics, people

Kendziora et. al.

Conclusions

- **Eye-safe** IR lasers have been utilized to selectively heat trace amounts of explosives to for photothermal imaging analysis.
- In photothermal detection applications (**RED**) a miniature IR quantum cascade laser (QCL) and thermal imaging detector have been used to detect and map trace explosives in a stand- off configuration.
- **RED** concept has been demonstrated on variety of substrates, analytes, in/out doors, and at significant standoff distances.
- Sponsored by OSD/RRTO and NRL

*Explosives Detection Workshop
at the University of Rhode Island*

9 October 2009

Air Infrared Transmission

- The fortuitous air window for explosives between 6 and 6.5 microns is away from night vision and missile heat seeking wavelengths
- We need to detect in LWIR because explosives are not “black bodies”
- Kirchhoff’s Law – their emissivity matches their absorptivity

Kendziora et. al.
Naval Research Laboratory

Explosives Detection Workshop
at the University of Rhode Island

9 October 2009

NRL/AdTech Optics QCL

- OEM/COTS c-mounted QCL from AdTech Optics
- Operates at room temperature and slightly above
- Temperature controlled for constant output λ and power
- >180 mW Continuous Wave (higher in pulsed mode)

Kendziora et. al.
Naval Research Laboratory

Explosives Detection Workshop
at the University of Rhode Island

9 October 2009

Interferent/“confusant” Testing

- Broadband absorbers will heat independent of wavelength.
- Distinguish this “confusant” by difference of differences
- $1325 \text{ counts}/19.5\text{mW} = 67.9$ ($\lambda = 1600 \text{ cm}^{-1}$)
- $766 \text{ counts}/11\text{mW} = 69.6$ ($\lambda = 1625 \text{ cm}^{-1}$)
- “Difference” $67.9 - 69.6 \sim \text{zero}$ (not an “analyte of interest”)

Differential images of carbon black sample on a gold mirror

When scaled by input power, the difference between the images is @ = zero.

Therefore the sample is not an “analyte of interest”.
